

Context

Nielsen reports that U.S. card fraud (credit, debit, etc) was reportedly 9 billion dollars in 2016 and is expected to increase to 12 billion dollars by 2020. For perspective, in 2017 both PayPal's and Mastercard's revenue was only \$10.8 billion each. Therefore, credit card companies must be able to recognize fraudulent credit card transactions so that customers are not charged for items that they did not purchase.

Objective

Suppose you are working as a Data Scientist in a Credit Card company named "**CCFraud**" and given the credit card transactions, you need to build a Model (i.e. Multilayer Perceptrons) for Fraud Detection using Keras

Attribute Information

- **Time:** Contains the seconds elapsed between each transaction and the first transaction in the dataset.
- **Amount:** It is the transaction Amount, this feature can be used, for example-dependent cost-sensitive learning.
- **Class:** It is the response variable and it takes value 1 in case of fraud and 0 otherwise.

Learning Outcomes:

- Exploratory Data Analysis
- Preparing the data to train a model
- Training the data using the Neural Network model
- Model evaluation
